AI-BERT VIBE CODING · ALBERT SCHOOL

01 · Ship something live

chaque étudiant a une page à son nom sur une URL publique, ouverte depuis son téléphone.

How to use this module

Work through it alone, at your own pace, in about an hour. Everything you need is here: the idea, the exact commands, the prompts to copy, and what to do when it breaks. Bring your questions to the weekly help hour. The last section is for the organisers.

The idea

Why your neighbour cannot open your page

You double-clicked `index.html` and it looked perfect. Then you sent the address to someone and they got nothing. Look at the address: it starts with `file://`. That is a path on **your** laptop, and nobody else has your laptop.

Three things that are actually true

A website is just files. The starter you downloaded has two: one for the words, one for the look. A giant site is the same idea with more files.

A URL is a computer that hands those files to whoever asks. Yours does not do that, and it is closed at night. Cloudflare owns computers that do nothing else, and lets you use them for free.

Deploying means copying your files onto that computer. That is the whole mystery. Once you have done it once, "putting something online" stops being a thing other people do.

The loop you will repeat for twelve weeks

You describe -> the agent writes the files -> you copy the files to Cloudflare -> a URL exists.

Tonight you do the loop by hand, with a drag and drop. In two weeks, step 03 makes the copy happen by itself every time you save. Same loop, less clicking.

Before you paste a prompt

Replace everything between < and > with your own words before you press Enter. The agent takes placeholders literally.

What Claude Code is, in one sentence

An agent that lives in your terminal, reads the files in the folder you opened it in, and edits them when you ask. It is not a chat window: when it says it changed something, the file on your disk actually changed. Open the file and check, every time, until you trust it.

Prompts for this module

Replace everything between < and > with your own words before you press Enter. The agent takes placeholders literally.

01 Make it mine

```
Read index.html and styles.css. Replace NAME with <your first name> and
rewrite the paragraph so it says one true thing about me: <the thing you
 care about>. Keep it to one page, do not add sections, do not add a men
u. Then tell me exactly which lines you changed.
```

02 One precise change

```
Change only the background colour of the page to something warm. Do not
touch anything else. List the lines you changed.
```

03 Check before I deploy

```
I am about to upload this folder to Cloudflare Pages. Check that index.h
tml and styles.css reference each other correctly and that nothing point
s to a file that does not exist. Answer in three lines maximum.
```

What you build

What you have at 00:57

A page with your name on it, opened from your own phone, at an address that starts with `https://`.

Where to start

Download the starter, unzip it, open a terminal **inside that folder** (Mac: type `cd ` , drag the folder in, Enter. Windows: type `cmd` in the folder's address bar), then type `claude`.

Download the starter

Constraints

- One page only. No menu, no second page. Tonight is about the loop, not the site.
- Your real first name on it, and one thing you actually care about.

Bonus, if you finish early

Make the page look like it belongs to you and nobody else. No hints. No fix published.

If you get stuck

1. `claude: command not found` -> the setup did not finish. Sit with your pair for tonight, and redo the setup step 2 at home.
2. **Cloudflare asks for a project name** -> anything lowercase without spaces, it becomes part of your URL. Write it down: you will need it next week.

3. **The page online shows the old version** -> it is your browser cache. Hard refresh: Cmd+Shift+R on Mac, Ctrl+Shift+R elsewhere.
4. Raise your hand.

Done means

Every line is something another person can check without reading your code. Tick them as you go.

- [ ] My page has my first name and one thing I care about
- [ ] It opens on my phone at an https:// address
- [ ] Someone else in the room opened it on their phone
- [ ] I posted the URL in the club group
- [ ] **Bonus.** it looks like it belongs to me and nobody else

How it was done

> **Read this after you have tried, not before.**
> The value of this module is in the attempt, not in the answer. If you are stuck for more than twenty minutes, read on.

What a good result looks like

A URL like `https://something.pages.dev` that opens on a phone, with your name in the title and one sentence that could only be written by you. That is a full score for step 01.

The exact steps, for the record

1. Unzip the starter. Open a terminal in that folder. Type `claude`.
2. Give it the first prompt from this page, with your own name and interest.
3. Open `index.html` in a browser and read what changed. If you dislike something, say precisely what, in one sentence.
4. Cloudflare dashboard -> Workers & Pages -> Create -> Pages -> Upload assets. Name the project. Drag the whole folder in.
5. Wait for the green tick, open the URL on your phone, post it in the group.

The two mistakes almost everyone made

Sending a `file://` address. It only works on your own machine.

Uploading a single file instead of the folder. Cloudflare needs both `index.html` and `styles.css`, so drag the folder.

What we did not do on purpose

No git, no framework, no domain. Each of those is a whole step of the path. Tonight the point was that the loop is short, and you own it.

Pour les organisateurs

Cette dernière partie est en français et ne s'adresse pas aux membres. C'est le conducteur de l'heure d'entraide et la préparation à faire avant.

S01 — Ship something live · conducteur

Victoire de fin d'heure : chaque étudiant a une page à son nom sur une URL publique, ouverte depuis son téléphone.

Notion unique : la boucle prompt -> code -> déploiement. Rien d'autre. Pas de git, pas de framework.

Avant la séance

- Starter testé la veille : `public/starters/s01-ship-something-live.zip` s'ouvre et s'affiche.
- Refaire le chemin exact Cloudflare « Upload assets » la veille, capturer chaque écran, corriger les libellés dans ENONCE et CORRIGE si le dashboard a changé.
- Clé API partagée du club chargée et son plafond vérifié, pour les étudiants sans abonnement.
- Compte Cloudflare de démo connecté, un projet Pages vide déjà créé pour gagner 2 minutes.
- Vérifier que la séance 1 est **ouverte** dans l'admin, sinon personne ne voit les prompts.
- Salle ouverte 10 min avant pour le dépannage setup. Un étudiant sans `claude` qui répond ne suit pas, il regarde : binôme immédiat.

00:00–00:03 · Accueil

Une phrase : « À 00:60, vous m'envoyez un lien que j'ouvre sur mon téléphone. C'est tout le cours. »

00:03–00:08 · L'échec

1. Ouvrir `index.html` du starter en double-cliquant. Ça s'affiche. « Génial, c'est en ligne ? »
2. Copier l'URL de la barre d'adresse : `file:///Users/…`. L'envoyer sur le WhatsApp du groupe. Demander à quelqu'un de l'ouvrir. Ça ne marche pas.
3. Ne rien expliquer encore. Laisser la question : pourquoi ?

00:08–00:20 · Le concept, trois affirmations

1. **Un site, c'est des fichiers.** Le starter en a deux. Rien de plus mystérieux.
2. **Une URL, c'est un ordinateur qui donne ces fichiers à qui les demande.** Le tien ne le fait pas, et il est éteint la nuit. Cloudflare a des ordinateurs pour ça, gratuits.
3. **Déployer, c'est copier tes fichiers sur cet ordinateur-là.** Une fois compris, tu ne penses plus jamais « mettre en ligne » comme un truc magique.

Puis la boucle au tableau : je décris -> l'agent écrit les fichiers -> je copie les fichiers là-bas -> URL. Trois flèches.

00:20–00:28 · La démo

1. Ouvrir le terminal dans le dossier starter, `claude`.
2. Prompt 1 tel quel, projeté. Regarder l'agent modifier `index.html`. Ouvrir, montrer.
3. Cloudflare : Workers & Pages -> Create -> Pages -> **Upload assets** -> nom du projet -> glisser le dossier. Attendre. Ouvrir l'URL sur le téléphone, le brandir.
4. Modifier une phrase avec le prompt 2, ré-uploader. « Un changement, c'est ça. »

00:28–00:30 · Lancement

Énoncé projeté. Binômes imposés : un qui a le setup complet avec un qui a bloqué. Starter téléchargé depuis la page de séance.

00:30–00:57 · Pratique

Circuler. Ne pas taper à la place. Les trois pannes probables sont sur l'énoncé.

À 00:45 : prévenir deux volontaires pour la vitrine.

00:57–01:00 · Vitrine

Deux écrans partagés, 60 s chacun. Un qui marche, un qui a cassé si possible. Rappeler : URL dans le groupe = case cochée.

Après

- Publier le corrigé le soir même (déverrouiller la solution dans l'admin).
- RETEX : combien ont coché toute la DoD ? Sous 60 %, l'exercice est trop dur, pas le groupe.
